

FOR COMPANIES RUNNING ON EOS®

Which finance numbers belong on your Scorecard?

The EOS Cash Scorecard: ten weekly finance measurables, each with an owner, a red/green target, and the 30-minute routine to compile them. Built to drop into your next L10.

The test: a strong Scorecard is full of activity-based numbers you can move this week. If your finance rows are monthly P&L numbers, they are lagging indicators wearing a Scorecard costume.

The answer on one page

Ten finance measurables, weekly, each owned by a seat (not a person). Green means no discussion needed. Red means it drops to the Issues List and gets IDSed. That is the entire system.

#	Measurable	Owner (seat)	Green when
1	Weeks of payroll in the bank	Finance	8 or more
2	Cash forecast accuracy (last week)	Finance	Within 5%
3	AR over 60 days	Collections	Under 5% of total AR
4	Invoices out within 3 days of work done	Billing / Ops	95% or more
5	Gross margin last week	Finance	At or above target
6	Jobs or clients below margin floor	Ops	Zero new this week
7	AP exceptions (duplicates, off-contract)	Finance	Zero
8	Spend approved vs. weekly budget	Integrator	Within budget
9	Payroll as % of revenue (rolling 4 weeks)	Integrator	At or below plan
10	Quoted margin on new bids	Sales	At or above floor

Set the exact green thresholds with your leadership team in one sitting. The numbers above are defensible defaults, not commandments. What matters is that every row has an owner, a target, and a weekly cadence.

Rule of thumb: if a row stays green for a full quarter, consider swapping it for the next weakest number. The Scorecard earns its 13 weeks of history; do not churn it weekly.

The ten checks

Each check below names what to pull, why it is weekly, and where the red/green line sits. Owners are seats from your Accountability Chart, never people.

1. Weeks of payroll in the bank

Cash on hand divided by your average weekly payroll. The single fastest read on survival. Pull it from the bank feed, not the GL; the GL is whatever the close says it is, the bank is true.

Green: 8 or more weeks. Red below 6 triggers the 13-week forecast conversation, not a panic.

2. Cash forecast accuracy

Last week's actual ending cash against what your 13-week forecast said it would be. This measurable keeps the forecast honest. A forecast nobody scores is a wish.

Green: within 5%. Repeated misses in the same direction tell you which assumption is broken.

3. AR over 60 days

Dollars sitting in receivables older than 60 days, and the number of accounts. This is money you already earned. The activity twin, if you want a second row: collection calls made this week.

Green: under 5% of total AR. Every red week, someone owns a named list of calls.

4. Invoices out within 3 days

Percentage of completed work invoiced within 3 days. Billing lag is the most common self-inflicted cash wound we see: the work is done, the cash clock has not started.

Green: 95% or more. Cutting a 9-day lag to 3 days is a one-time cash pull worth weeks of payroll.

5. Gross margin last week

Margin on last week's delivered work, by line of business if you have more than one. Weekly margin is the difference between catching a profit leak in week 2 and reading about it in the monthlies.

Green: at or above your target margin. Set the target from your best recent quarter, not a wish.

6. Jobs or clients below the margin floor

Count of jobs, projects, or clients that dipped below your minimum acceptable margin this week. The floor forces the conversation EOS people know well: right client, right work, right price.

Green: zero new exceptions. Each exception gets a one-line cause on the Issues List.

7. AP exceptions

Duplicate payments, payments outside contract terms, and off-contract spend caught this week. Boring, mechanical, and worth real money. This is where audits find the easy five figures.

Green: zero. If you cannot measure it, that is the finding.

8. Spend approved vs. weekly budget

Dollars of new spend approved this week against the weekly budget envelope. This is the row that ends both failure modes: the pizza-party sign-off bottleneck and the nobody-is-watching free-for-all.

Green: within budget. Department leads run free inside their envelope; the Scorecard watches the envelope.

9. Payroll as a percent of revenue

Rolling 4-week payroll divided by rolling 4-week revenue. The earliest structural warning you can get: it moves before margin, before cash, before anyone feels it.

Green: at or below plan. A two-week drift is a trend, not noise. IDS it.

10. Quoted margin on new bids

Average margin on quotes and proposals issued this week. Pricing discipline is a leading indicator by definition: today's weak quote is next quarter's red margin row.

Green: at or above your pricing floor. Track wins separately; do not let win rate excuse thin quotes.

The 30-minute Friday routine

One person, usually the finance seat, compiles the Scorecard every Friday so it is waiting for Monday's L10. The whole pull takes 30 minutes once the sources are wired:

1	Bank feed: cash balance, weeks of payroll, forecast variance	5 min
2	AR aging report: over-60 dollars and account count	5 min
3	Billing log: completed work vs. invoices issued	5 min
4	Job or client margin report: last week's delivered work	7 min
5	AP run review: exceptions, approvals vs. budget	5 min
6	Mark every row red or green; red rows go to the Issues List	3 min

If any single pull takes longer than the minutes above, the problem is the source system, not the person. That is exactly the kind of choke point a finance rhythm install removes.

The 13-week companion

The Scorecard tells you what happened this week. The 13-week cash forecast tells you what happens next, on the same horizon as your Rocks. The two run together:

- One page. Thirteen columns, one per week. Rows: starting cash, collections in, payroll out, AP out, other out, ending cash.
- Updated every Friday in the same 30-minute sitting, after the Scorecard pull.
- Week 1 accuracy feeds Scorecard row 2. The forecast and the Scorecard keep each other honest.
- Every Rock candidate at quarterly planning gets costed against it before it gets a vote.

Reply to the delivery email and we will send the 13-week template as a working spreadsheet.

A representative first pull

The numbers below are representative of what first pulls surface at companies this size. They are not a single client engagement.

Picture a \$14M services company running on EOS, two years in. L10s tight, Rocks landing, Scorecard strong on sales and ops, finance rows monthly and late. A typical first Friday pull looks like this:

Row	First pull	13 weeks later
Weeks of payroll in the bank	4.1 (red)	7.8
AR over 60	\$212,000 across 14 accounts (red)	\$61,000 across 4 accounts
Invoices out within 3 days	Average lag 9 days (red)	96% within 3 days
AP exceptions	Unknown, not measured (red)	\$18,400 recovered, then zero
Quoted margin on new bids	Not tracked (red)	Floor set, two bids repriced

Nothing on that list required new software or a hero CFO. It required ten rows, ten owners, and a Friday routine that nobody is allowed to skip.

IF THE ROWS COME UP RED AND NOBODY CAN FIX THEM

That is not a people problem. It is a missing system. We install the full financial rhythm in one EOS quarter: 10-day close, daily cash visibility, the 13-week forecast, and the Scorecard rows above, running without us by Day 90. The engagement self-funds: if the first 14 days do not surface at least 3x the monthly fee, you do not pay.
